

Enhancing the Fylo project

Add the following functionality to your **existing** Fylo project:

1. Add the ability to upload an image file
 - a. The page should contain a button with the text "Upload image".
 - b. Clicking on the button should open the Finder/File Explorer.
 - c. The user should be able to select any file format.
 - d. The database can store only image formats, therefore, if the user tries to upload a non-image file, he should receive the following error (using the browser's alert):
"File format isn't supported"
Note: Allowed image formats: .jpg, .jpeg, .gif, .png
2. Show the available disk space
 - a. The **total** disk space should be displayed.
 - b. If the user selects a valid file, the available space should be updated (using an animation).
 - c. If the size of the selected file is bigger than the available space, he should receive the following error: "There is not enough space on the disk"
Note: The total disk space should be stored in a global variable

Bonus:

1. Add the ability to upload multiple files (in the same operation, or in a separate one).
2. The app will save the state even if the user refreshes the page.
